# 1 Introduction

## 1.1 Scope

The present document describes the AT Command Set for the SIMCom Module:  
SIM7500 series, SIM7600 series.

More information about the SIMCom Module which includes the Software Version information can be retrieved by the command [ATI](#). In this document, a short description, the syntax, the possible setting values and responses, and some examples of AT commands are presented.

Prior to using the Module, please read this document and the Version History to know the difference from the previous document.

In order to implement communication successfully between Customer Application and the Module, it is recommended to use the AT commands in this document, but not to use some commands which are not included in this document.

## 1.4 Definitions and conventions

1. For the purposes of the present document, the following syntactical definitions apply:

**<CR>** Carriage return character.

**<LF>** Linefeed character.

**<...>** Name enclosed in angle brackets is a syntactical element. Brackets themselves do not appear in the command line.

**[...]** Optional subparameter of AT command or an optional part of TA information response is enclosed in square brackets. Brackets themselves do not appear in the command line.

If subparameter is not given, its value equals to its previous value or the recommended default value.

**underline** Underlined defined subparameter value is the recommended default setting or factory setting.

2. Document conventions:

- ◆ Display the examples of AT commands with *Italic* format.
- ◆ Not display *blank-line* between command line and responses or inside the responses.
- ◆ Generally, the characters <CR> and <LF> are intentionally omitted throughout this document.
- ◆ If command response is ERROR, not list the ERROR response inside command syntax.

**NOTE:** AT commands and responses in figures may be not following above conventions.

3. Special marks for commands or parameters:

**SIM PIN** – Is the command PIN protected?

YES – AT command can be used only when SIM PIN is READY.

NO – AT command can be used when SIM card is absent or SIM PIN validation is pending.

**References** – Where is the derivation of command?

3GPP TS 27.007 – 3GPP Technical Specification 127 007.

V.25ter – ITU-T Recommendation V.25ter.

Vendor – This command is supported by SIMCom.

## 2 AT Interface Synopsis

### 2.1 Interface settings

Between Customer Application and the Module, standardized RS-232 interface is used for the communication, and default values for the interface settings as following:

115200bps, 8 bit data, no parity, 1 bit stop, no data stream control.

### 2.2 AT command syntax

The prefix “AT” or “at” (no case sensitive) must be included at the beginning of each command line (except `A/` and `+++`), and the character `<CR>` is used to finish a command line so as to issue the command line to the Module. It is recommended that a command line only includes a command.

When Customer Application issues a series of AT commands on separate command lines, leave a pause between the preceding and the following command until information responses or result codes are retrieved by Customer Application, for example, “OK” is appeared. This advice avoids too many AT commands are issued at a time without waiting for a response for each command.

In the present document, AT commands are divided into three categories: Basic Command, S Parameter Command, and Extended Command.

#### 1. Basic Command

The format of Basic Command is “AT<x><n>” or “AT&<x><n>”, “<x>” is the command name, and “<n>” is/are the parameter(s) for the basic command, and optional. An example of Basic Command is “`ATE<n>`”, which informs the TA/DCE whether received characters should be echoed back to the TE/DTE according to the value of “<n>”; “<n>” is optional and a default value will be used if omitted.

#### 2. S Parameter Command

The format of S Parameter Command is “`ATS<n>=<m>`”, “<n>” is the index of the S-register to set, and “<m>” is the value to assign to it. “<m>” is optional; in this case, the format is “`ATS<n>`”, and then a default value is assigned.

#### 3. Extended Command

The Extended Command has several formats, as following table list:

**Table 2-1: Types of Extended Command**

Command Type	Syntax	Comments
Test Command	AT+<NAME>=?	Test the existence of the command; give some information about the command subparameters.
Read Command	AT+<NAME>?	Check the current values of subparameters.
Write Command	AT+<NAME>=<...>	Set user-definable subparameter values.
Execution Command	AT+<NAME>	Read non-variable subparameters determined by internal processes.

**NOTE:** The character “+” between the prefix “AT” and command name may be replaced by other character. For example, using “#” or “\$” instead of “+”.

### 2.3 Information responses

If the commands included in the command line are supported by the Module and the subparameters are correct if presented, some information responses will be retrieved by from the Module. Otherwise, the Module will report “ERROR” or “+CME ERROR” or “+CMS ERROR” to Customer Application.

Information responses start and end with <CR><LF>, i.e. the format of information responses is “<CR><LF><response><CR><LF>”. Inside information responses, there may be one or more <CR><LF>. Throughout this document, only the responses are presented, and <CR><LF> are intentionally omitted.

## 3 AT Commands According V.25TER

### 3.1 A/ Repeat last command

#### Description

This command is used for implement previous AT command repeatedly (except A/), and the return value depends on the last AT command. If A/ is issued to the Module firstly after power on, the response “OK” is only returned.

### 3.34 AT+CIMIM Request another international mobile subscriber identity

#### Description

Execution command causes the TA to return `<IMSI>`, which is intended to permit the TE to identify the individual SIM card which is attached to MT.

NOTE: If USIM card contains two apps, like China Telecom 4G card, one RUIM/CSIM app, and another USIM app; so there are two IMSI in it; AT+CIMIM will return the USIM IMSI; AT+CIMI will return the RUIM/CSIM IMSI;

## 4 AT Commands for Status Control

### 4.1 AT+CFUN Set phone functionality

#### Description

This command is used to select the level of functionality `<fun>` in the ME. Level "full functionality" is where the highest level of power is drawn. "Minimum functionality" is where minimum power is drawn. Level of functionality between these may also be specified by manufacturers. When supported by manufacturers, ME resetting with `<rst>` parameter may be utilized.

**NOTE:** `AT+CFUN=6` must be used after setting `AT+CFUN=7`. If module in offline mode, must execute `AT+CFUN=6` or restart module to online mode.

## 4.2 AT+CPIN Enter PIN

### Description

This command is used to send the ME a password which is necessary before it can be operated (SIM PIN, SIM PUK, PH-SIM PIN, etc.). If the PIN is to be entered twice, the TA shall automatically repeat the PIN. If no PIN request is pending, no action is taken towards MT and an error message, +CME ERROR, is returned to TE.

If the PIN required is SIM PUK or SIM PUK2, the second pin is required. This second pin, <newpin>, is used to replace the old pin in the SIM.

## 4.4 AT+CSIM Generic SIM access

### Description

This command is used to control the SIM card directly.

Compared to restricted SIM access command [AT+CRSM](#), [AT+CSIM](#) allows the ME to take more control over the SIM interface.

For SIM-ME interface please refer 3GPP TS 11.11.

**NOTE:** The SIM Application Toolkit functionality is not supported by [AT+CSIM](#). Therefore the following SIM commands can not be used: [TERMINAL PROFILE](#), [ENVELOPE](#), [FETCH](#) and [TEMINAL RESPONSE](#).

## 4.5 AT+CRSM Restricted SIM access

### Description

By using **AT+CRSM** instead of Generic SIM Access **AT+CSIM**, TE application has easier but more limited access to the SIM database.

Write command transmits to the MT the SIM **<command>** and its required parameters. MT handles internally all SIM-MT interface locking and file selection routines. As response to the command, MT sends the actual SIM information parameters and response data. MT error result code +CME ERROR may be returned when the command cannot be passed to the SIM, but failure in the execution of the command in the SIM is reported in **<sw1>** and **<sw2>** parameters.

## 5.2 AT+COPS Operator selection

### Description

Write command forces an attempt to select and register the GSM/UMTS network operator. `<mode>` is used to select whether the selection is done automatically by the ME or is forced by this command to operator `<oper>` (it shall be given in format `<format>`). If the selected operator is not available, no other operator shall be selected (except `<mode>=4`). The selected operator name format shall apply to further read commands (`AT+COPS?`) also. `<mode>=2` forces an attempt to deregister from the network. The selected mode affects to all further network registration (e.g. after `<mode>=2`, ME shall be unregistered until `<mode>=0` or 1 is selected).

Read command returns the current mode and the currently selected operator. If no operator is selected, `<format>` and `<oper>` are omitted.

Test command returns a list of quadruplets, each representing an operator present in the network. Quadruplet consists of an integer indicating the availability of the operator `<stat>`, long and short alphanumeric format of the name of the operator, and numeric format representation of the operator. Any of the formats may be unavailable and should then be an empty field. The list of operators shall be in order: home network, networks referenced in SIM, and other networks.

It is recommended (although optional) that after the operator list TA returns lists of supported `<mode>`s and `<format>`s. These lists shall be delimited from the operator list by two commas.

When executing `AT+COPS=?`, any input from serial port will stop this command.

### Description

This command refers to supplementary service related network initiated notifications. The set command enables/disables the presentation of notification result codes from TA to TE.

When  $\langle n \rangle = 1$  and a supplementary service notification is received after a mobile originated call setup, intermediate result code +CSSI:  $\langle code1 \rangle [ , \langle index \rangle ]$  is sent to TE before any other MO call setup result codes presented in the present document. When several different  $\langle code1 \rangle$ s are received from the network, each of them shall have its own +CSSI result code.

When  $\langle m \rangle = 1$  and a supplementary service notification is received during a mobile terminated call setup or during a call, or when a forward check supplementary service notification is received, unsolicited result code +CSSU:  $\langle code2 \rangle [ , \langle index \rangle [ , \langle number \rangle , \langle type \rangle [ , \langle subaddr \rangle , \langle satype \rangle ] ] ]$  is sent to TE. In case of MT call setup, result code is sent after every +CLIP result code (refer command "Calling line identification presentation +CLIP") and when several different  $\langle code2 \rangle$ s are received from the network, each of them shall have its own +CSSU result code.

**NOTE:** This command not supported in CDMA/HDR mode.

## 5.16 AT+CEREG EPS network registration status

### Description

The set command controls the presentation of an unsolicited result code +CEREG: <stat> when <n>=1 and there is a change in the MT's EPS network registration status in E-UTRAN, or unsolicited result code +CEREG: <stat>[,<tac>,<ci>[,<AcT>]] when <n>=2 and there is a change of the network cell in E-UTRAN; in this latest case <AcT>, <tac> and <ci> are sent only if available.

NOTE 1: If the EPS MT in GERAN/UTRAN/E-UTRAN also supports circuit mode services and/or GPRS services, the +CREG command and +CREG: result codes and/or the +CGREG command and +CGREG: result codes apply to the registration status and location information for those services.

The read command returns the status of result code presentation and an integer <stat> which shows whether the network has currently indicated the registration of the MT. Location information elements <tac>, <ci> and <AcT>, if available, are returned only when <n>=2 and MT is registered in the network.

### Defined values

<on/off>

Integer type value indicating:

- 0 – Disable automatic time zone update via NITZ (default).
- 1 – Enable automatic time zone update via NITZ.

**NOTE:** 1. The value of < on/off > is nonvolatile, and factory value is 0.

2. For automatic time and time zone update is enabled (+CTZU=1):

If time zone is only received from network and it isn't equal to local time zone (AT+CCLK), time zone is updated automatically, and real time clock is updated based on local time and the difference between time zone from network and local time zone (Local time zone must be valid).

If Universal Time and time zone are received from network, both time zone and real time clock is updated automatically, and real time clock is based on Universal Time and time zone from network.

<on/off>

Integer type value indicating:

- 0 – Disable time zone change event reporting (default).
- 1 – Enable time zone change event reporting.

+CTZV: <tz>[,<time>][,<dst>]

Unsolicited result code when time zone received from network isn't equal to local time zone, and if

the informations from network don't include date and time, time zone will be only reported, and if network daylight saving time is present, it is also reported. For example:

```
+CTZV: 32 (Only report time zone)
+CTZV: 32,1 (Report time zone and network daylight saving time)
+CTZV: 32,08/12/09,17:00:00 (Report time and time zone)
+CTZV: 32,08/12/09,17:00:00,1 (Report time, time zone and daylight saving time)
```

For more detailed informations about time and time zone, please refer 3GPP TS 24.008.

- <tz> Local time zone received from network.
- <time> Universal time received from network, and the format is “yy/MM/dd, hh:mm:ss”, where characters indicate year (two last digits), month, day, hour, minutes and seconds.
- <dst> Network daylight saving time, and if it is received from network, it indicates the value that has been used to adjust the local time zone. The values as following:
  - 0 – No adjustment for Daylight Saving Time.
  - 1 – +1 hour adjustment for Daylight Saving Time.
  - 2 – +2 hours adjustment for Daylight Saving Time.

**NOTE:** Herein, <time> is Universal Time or NITZ time, but not local time.

## 6.12 AT+CLIP Calling line identification presentation

### Description

This command refers to the GSM/UMTS supplementary service CLIP (Calling Line Identification Presentation) that enables a called subscriber to get the calling line identity (CLI) of the calling party when receiving a mobile terminated call.

Write command enables or disables the presentation of the CLI at the TE. It has no effect on the execution of the supplementary service CLIP in the network.

When the presentation of the CLI at the TE is enabled (and calling subscriber allows), +CLIP: <number>,<type>,,[,<alpha>][,<CLI validity>] response is returned after every RING (or +CRING: <type>; refer sub clause "Cellular result codes +CRC") result code sent from TA to TE. It is manufacturer specific if this response is used when normal voice call is answered.

## 6.13 AT+CLIR Calling line identification restriction

### Description

This command refers to CLIR-service that allows a calling subscriber to enable or disable the presentation of the CLI to the called party when originating a call.

Write command overrides the CLIR subscription (default is restricted or allowed) when temporary mode is provisioned as a default adjustment for all following outgoing calls. This adjustment can be revoked by using the opposite command.. If this command is used by a subscriber without provision of CLIR in permanent mode the network will act.

Read command gives the default adjustment for all outgoing calls (given in <n>), and also triggers an interrogation of the provision status of the CLIR service (given in <m>).

Test command returns values supported as a compound value.

## 6.14 AT+COLP Connected line identification presentation

### Description

This command refers to the GSM/UMTS supplementary service COLP(Connected Line Identification Presentation) that enables a calling subscriber to get the connected line identity (COL) of the called party after setting up a mobile originated call. The command enables or disables the presentation of the COL at the TE. It has no effect on the execution of the supplementary service COLR in the network.

When enabled (and called subscriber allows), +COLP:<number>, <type> [,<subaddr>, <satype> [,<alpha>]] intermediate result code is returned from TA to TE before any +CR responses. It is

manufacturer specific if this response is used when normal voice call is established.

When the AT+COLP=1 is set, any data input immediately after the launching of “ATDXXX;” will stop the execution of the ATD command, which may cancel the establishing of the call.

## 6.15 AT+VTS DTMF and tone generation

### Description

This command allows the transmission of DTMF tones and arbitrary tones which cause the Mobile Switching Center (MSC) to transmit tones to a remote subscriber. The command can only be used in voice mode of operation (active voice call).

**NOTE:** The END event of voice call will terminate the transmission of tones, and as an operator option, the tone may be ceased after a pre-determined time whether or not tone duration has been reached.

SIM PIN	References
NO	3GPP TS 27.007

### Syntax

Test Command	Responses
AT+VTS=?	+VTS: (list of supported<dtmf>s) OK
Write Command	Responses
AT+VTS=<dtmf> [,<duration>]	OK
AT+VTS=<dtmf-string>	ERROR

### Defined values

<dtmf>

A single ASCII character in the set 0-9, \*, #, A, B, C, D.

<duration>

Tone duration in 1/10 seconds, from 0 to 255. This is interpreted as a DTMF tone of different duration from that mandated by the [AT+VTD](#) command, otherwise, the duration which be set the [AT+VTD](#) command will be used for the tone (<duration> is omitted).

<dtmf-string>

A sequence of ASCII character in the set 0-9, \*, #, A, B, C, D, and maximal length of the string is 29. The string must be enclosed in double quotes (“”), and separated by commas between the ASCII characters (e.g. “1,3,5,7,9,\*”). Each of the tones with a duration which is set by the [AT+VTD](#) command.

## Examples

```

AT+VTS=1
OK
AT+VTS=1,20
OK
AT+VTS="1,3,5"
OK
AT+VTS=?
+VTS: (0-9,*,#,A,B,C,D)
OK
    
```

## 6.16 AT+VTD Tone duration

### Description

This refers to an integer `<n>` that defines the length of tones emitted as a result of the `AT+VTS` command. A value different than zero causes a tone of duration `<n>/10` seconds.

### Defined values

`<n>`

Tone duration in integer format, from 0 to 255, and 0 is factory value.

0 Tone duration of every single tone is dependent on the network.

1...255 Tone duration of every single tone in 1/10 seconds.

### Examples

### Defined values

[<type>](#)

Type of address octet in integer format:

- 145 – when dialling string includes international access code character “+”
- 161 – national number. The network support for this type is optional
- 177 – network specific number, ISDN format
- 129 – otherwise

**NOTE:** Because the type of address is automatically detected on the dial string of dialing command, command [AT+CSTA](#) has really no effect.

## 7.9 AT+CNMI New message indications to TE

### Description

This command is used to select the procedure how receiving of new messages from the network is indicated to the TE when TE is active, e.g. DTR signal is ON. If TE is inactive (e.g. DTR signal is OFF). If set `<mt>=3` or `<ds>=1`, make sure `<mode>=1`, If set `<mt>=2`, make sure `<mode>=1` or `2`, otherwise it will return error.

## Defined values

### <mode>

- 0 – Buffer unsolicited result codes in the TA. If TA result code buffer is full, indications can be buffered in some other place or the oldest indications may be discarded and replaced with the new received indications.
- 1 – Discard indication and reject new received message unsolicited result codes when TA-TE link is reserved (e.g. in on-line data mode). Otherwise forward them directly to the TE.
- 2 – Buffer unsolicited result codes in the TA when TA-TE link is reserved (e.g. in on-line data mode) and flush them to the TE after reservation. Otherwise forward them directly to the TE.

### <mt>

The rules for storing received SMS depend on its data coding scheme, preferred memory storage (**AT+CPMS**) setting and this value:

- 0 – No SMS-DELIVER indications are routed to the TE.
- 1 – If SMS-DELIVER is stored into ME/TA, indication of the memory location is routed to the TE using unsolicited result code: +CMTI: <mem3>,<index>.
- 2 – SMS-DELIVERS (except class 2 messages and messages in the message waiting indication group (store message)) are routed directly to the TE using unsolicited result code:  
 +CMT:[<alpha>],<length><CR><LF><pdu> (PDU mode enabled); or  
 +CMT:<oa>,<alpha>,<scts>[,<toa>,<fo>,<pid>,<dcs>,<sca>,<tosca>,<length>]  
 <CR> <LF><data>  
 (text mode enabled, about parameters in italics, refer command Show Text Mode Parameters **AT+CSDH**).
- 3 – Class 3 SMS-DELIVERS are routed directly to TE using unsolicited result codes defined in <mt>=2. Messages of other data coding schemes result in indication as defined in <mt>=1.

### <bm> (not used in CDMA/EVDO mode)

The rules for storing received CBMs depend on its data coding scheme, the setting of Select CBM Types (**AT+CSCB**) and this value:

- 0 – No CBM indications are routed to the TE.
- 2 – New CBMs are routed directly to the TE using unsolicited result code:  
 +CBM: <length><CR><LF><pdu> (PDU mode enabled); or

+CBM: <sn>,<mid>,<dc>,<page>,<pages><CR><LF><data> (text mode enabled)	
<ds> (not used in CDMA/EVDO mode)	
0	No SMS-STATUS-REPORTs are routed to the TE.
1	SMS-STATUS-REPORTs are routed to the TE using unsolicited result code: +CDS: <length><CR><LF><pdu> (PDU mode enabled); or +CDS: <fo>,<mr>,<ra>,<tora>,<scts>,<dt>,<st> (text mode enabled)
2	If SMS-STATUS-REPORT is stored into ME/TA, indication of the memory location is routed to the TE using unsolicited result code: +CDSI: <mem3>,<index>.
<bfr>	
0	TA buffer of unsolicited result codes defined within this command is flushed to the TE when <mode> 1 to 3 is entered (OK response shall be given before flushing the codes).
1	TA buffer of unsolicited result codes defined within this command is cleared when <mode> 1 to 3 is entered.

## 9.6 AT+CGTFT Traffic Flow Template

### Description

This command allows the TE to specify a Packet Filter - PF for a Traffic Flow Template - TFT that is used in the GGSN in UMTS/GPRS and Packet GW in EPS for routing of packets onto different QoS flows towards the TE. The concept is further described in the 3GPP TS 23.060 [47]. A TFT consists of from one and up to 16 Packet Filters, each identified by a unique <packet filter identifier>. A Packet Filter also has an <evaluation precedence index> that is unique within all TFTs associated with all PDP contexts that are associated with the same PDP address.

## 9.8 AT+CGEQREQ 3G quality of service profile (requested)

### Description

The test command returns values supported as a compound value.

The read command returns the current settings for each defined context for which a QOS was explicitly specified.

The write command allows the TE to specify a Quality of Service Profile for the context identified

by the context identification parameter `<cid>` which is used when the MT sends an Activate PDP Context Request message to the network.

A special form of the write command, `AT+CGEQREQ=<cid>` causes the requested profile for context number `<cid>` to become undefined.

## 9.14 AT+CGEREP GPRS event reporting

### Description

The write command enables or disables sending of unsolicited result codes, “+CGEV” from MT to TE in the case of certain events occurring in the Packet Domain MT or the network. `<mode>` controls the processing of unsolicited result codes specified within this command. `<bfr>` controls the effect on buffered codes when `<mode>` 1 or 2 is entered. If a setting is not supported by the MT, ERROR or +CME ERROR: is returned.

Read command returns the current `<mode>` and buffer settings.

Test command returns the modes and buffer settings supported by the MT as compound values.

SIM PIN	References
YES	3GPP TS 27.007

### Syntax

Test Command	Responses
AT+CGEREP=?	+CGEREP: (list of supported <code>&lt;mode&gt;</code> s),(list of supported <code>&lt;bfr&gt;</code> s) OK ERROR
Read Command	Responses

AT+CGEREP= <code>&lt;mode&gt;</code> [, <code>&lt;bfr&gt;</code> ]	OK ERROR +CME ERROR: <code>&lt;err&gt;</code>
Execution Command	Responses
AT+CGEREP	OK ERROR

## Defined values

### <mode>

- 0 – buffer unsolicited result codes in the MT; if MT result code buffer is full, the oldest ones can be discarded. No codes are forwarded to the TE.
- 1 – discard unsolicited result codes when MT-TE link is reserved (e.g. in on-line data mode); otherwise forward them directly to the TE.
- 2 – buffer unsolicited result codes in the MT when MT-TE link is reserved (e.g. in on-line data mode) and flush them to the TE when MT-TE link becomes available; otherwise forward them directly to the TE.

### <bfr>

- 0 – MT buffer of unsolicited result codes defined within this command is cleared when <mode> 1 or 2 is entered.
- 1 – MT buffer of unsolicited result codes defined within this command is flushed to the TE when <mode> 1 or 2 is entered (OK response shall be given before flushing the codes).

The following unsolicited result codes and the corresponding events are defined:

+CGEV: REJECT <PDP\_type>, <PDP\_addr>

A network request for PDP context activation occurred when the MT was unable to report it to the TE with a +CRING unsolicited result code and was automatically rejected.

+CGEV: NW REACT <PDP\_type>, <PDP\_addr>, [<cid>]

The network has requested a context reactivation. The <cid> that was used to reactivate the context is provided if known to the MT.

+CGEV: NW DEACT <PDP\_type>, <PDP\_addr>, [<cid>]

The network has forced a context deactivation. The <cid> that was used to activate the context is provided if known to the MT.

+CGEV: ME DEACT <PDP\_type>, <PDP\_addr>, [<cid>]

The mobile equipment has forced a context deactivation. The <cid> that was used to activate the context is provided if known to the MT.

+CGEV: NW DETACH

The network has forced a Packet Domain detach. This implies that all active contexts have been deactivated. These are not reported separately.

+CGEV: ME DETACH

The mobile equipment has forced a Packet Domain detach. This implies that all active contexts have been deactivated. These are not reported separately.

+CGEV: NW CLASS <class>

The network has forced a change of MS class. The highest available class is reported (see [AT+CGCLASS](#)).

+CGEV: ME CLASS <class>

The mobile equipment has forced a change of MS class. The highest available class is reported (see [AT+CGCLASS](#)).

## 11 AT Commands for SIM Application Toolkit

### 11.1 AT+STIN SAT Indication

#### Description

Every time the SIM Application issues a Proactive Command, via the ME, the TA will receive an indication. This indicates the type of Proactive Command issued.

**AT+STGI** must then be used by the TA to request the parameters of the Proactive Command from the ME. Upon receiving the **+STGI** response from the ME, the TA must send **AT+STGR** to confirm the execution of the Proactive Command and provide any required user response, e.g. a selected menu item.

SIM PIN	References
YES	Vendor

#### Syntax

Test Command	Responses
AT+STIN=?	OK
Read Command	Responses
AT+STIN?	+STIN: <cmd_id>  OK

#### Unsolicited Result Codes

+STIN: <cmd\_id>

Proactive Command notification

- 21 – display text
- 22 – get inkey
- 23 – get input
- 24 – select item

+STIN: 25

Notification that SIM Application has returned to main menu. If user doesn't do any action in 2 minutes, application will return to main menu automatically.

#### Defined values

<cmd\_id>

- 21 – display text
- 22 – get inkey

- 23 – get input
- 24 – select item
- 25 – set up menu

## 11.2 AT+STGI Get SAT information

### Description

Regularly this command is used upon receipt of an URC "+STIN" to request the parameters of the Proactive Command. ## 13 AT Commands for File System

The file system is used to store files in a hierarchical (tree) structure, and there are some definitions and conventions to use the Module.

Local storage space is mapped to “C:”, “D:” for TF card, “E:” for multimedia.

**NOTE:** General rules for naming (both directories and files):

- 1 The length of actual fully qualified names of directories and files can not exceed 254.
- 2 Directory and file names can not include the following characters:  
 \ : \* ? “ < > | , ;
- 3 Between directory name and file/directory name, use character “/” as list separator, so it can not appear in directory name or file name.
- 4 The first character of names must be a letter or a numeral or underline, and the last character can not be period “.” and oblique “/”.

## 15.2.2 AT+CIPSENDMODE Select sending mode

### Description

This command is used to sending wait peer TCP ACK mode or sending without waiting peer TCP ACK mode. The default mode is sending without waiting peer TCP ACK mode.

**NOTE:** Currently SIMCom 3G modules support both new TCP/IP command set and old TCP/IP command set, the new TCP/IP command set support multiple TCP connections, and backward compatible with the old command set. When the AT+NETOPEN command called with parameters(like AT+NETOPEN="TCP") according to the old command set, the sending mode configured by this command will be ignore, and the TCP data sending will wait for TCP ACK always.

## 17 AT Commands for GPS

### 17.1 AT+CGPS Start/Stop GPS session

#### Description

This command is used to start or stop GPS session.

#### NOTE:

1. Output of NMEA sentences is automatic; no control via AT commands is provided. At present the module only supports standalone mode. If executing `AT+CGPS=1`, the GPS session will choose cold or hot start automatically.
2. UE-based and UE-assisted mode depend on URL (`AT+CGPSURL`). When UE-based mode fails, it will switch standalone mode.
3. UE-assisted mode is singly fixed. Standalone and UE-based mode is consecutively fixed.
4. After the GPS closed, it should to wait about 2s~30s for start again. Reason: If the signal conditions are right (strong enough signals to allow ephemeris demodulation) or ephemeris demodulation is on going, sometimes MGP will stay on longer in order to demodulate more ephemeris. This will help the engine provide faster TTFF and possibly better yield later (up to 2 hours), because it has the benefit of more ephemeris available.
